ANALYSIS OF REPRODUCTION AND PRODUCTION  
PARAMETERS OF MOTHER POPULATIONS AND GENEALOGICAL  
BOAR POPULATIONS BY MEANS OF M BLUP-AM METHOD IN  
SLOVAKIA<sup>1</sup>

B. Bobček, P. Řeháček, V. Matoušek<sup>2</sup>

*Abstract:* This paper evaluates all population averages of mother population concerning both reproduction and production parameters in Slovakia during the years 1996 – 2001.

The prediction of breeding value of the best boar populations WI, WM and L during the period 2000 - 2002 was carried out by means of M BLUP-AM method.

Based on the achieved total population averages, the best breeds in regard to reproduction efficiency were WI and WM in year 2001, total live born piglets WI 11,28, WM 11,34 and L 10,59; new live born WI 10,75, WM 10,78, L 10,18 reared piglets WI 9,96, WM 9,88 and L 9,68.

On the basis of total breeding value (TBV), the best genealogical populations of mother breeds were evaluated and included in the “top ladder”.

In Slovakia the best genealogical boar populations of WI breed were as follows: Pintos with 806 total breeding value (TBV), SUNAR with 784,1 (TBV) Faber with 771.8 (TBV) total breeding value.

The best results in genealogical boar populations (WM breed) were achieved in Don with 701.7 total breeding value (TBV), Rank with 636.7 (TBV) total breeding value and Norik with 614.5 (TBV) total breeding value.

In Landrace the best populations were as follows: Floppy with 730.6 (TBV) total breeding value (TBV), Damborek with 634.3 (TBV) and Don with 723.4 (TBV).

M BLUP-AM method enables more precise evaluation of genetic value of individual animals and breeds and subsequently it provides more objective controlled selection and further breeding pig breeds.

*Key words:* pigs, Animal model, fattening and carcass value

#### *Introduction and references*

In recent years the main question of breeding and hybridization in Slovakia was how to improve meat efficiency at reduced feed consumption as well as how to maintain reproduction properties on a certain level. Further improvement in this area is impossible without optimization of breeding value prediction methods.

The more precise the breeding value is, the higher the breeding advancement can be expected. Therefore breeders are looking for the method of a precise prediction of values in pigs included in selection. Such precise prediction is enabled by BLUP method (Best Linear Unbiased Prediction). At present it is the most progressive method of breeding value prediction. The most optimum programme using M BLUP-AM method is PEST – *Groeneveld, Peškovičová (1999)*. This programme enables to achieve breeding values for the individual traits as well as multidimensional models and effects with more traits while respecting additive – genetic affinity.

Predictions by means of M BLUP-AM method include parameters of field test, fattening and carcass values from testing stations as well as reproduction parameters. The evaluation of mother populations emphasizes mainly the reproduction parameters since they have significant impact on breeding effectiveness and become an important part of breeding programmes. The problem of reproduction parameters has been dealt with by many authors – *Anderson, Karras (1994)*. Selection indices and prediction of breeding reproduction values were dealt with by *Flák et. al (1997), Bobček et. al. (1991), Matoušek et al. (1999), Wolfová, Wolf (1997), Peškovičová et al. (1997), Bobček, Řeháček (1999)* and others.

#### *Materials and Methods*

The results of control of efficiency degree I in Slovakia as well as data provided by the State Centre of Information Technology in Žilina helped us to evaluate total reproduction and production breeding population averages in Slovakia during the period 1996 – 2002. Genealogical boar populations in the individual mother breeds White

Improved (WI), White Meat (WM) and Landrace (L) were evaluated by means of M BLUP-AM method. This method has been widely used in Slovakia since January 2000. Recently, a two-year result of efficiency of individual hybridization breeding has been evaluated.

In year 2001 there were 83 breeding herds in Slovakia. The representations of the individual breeds were as follows: mother population WI - 45 breeding (5002 sows), WM – 14 breeding (1337 sows) and L – 6 breeding (558 sows), which in total represents 65 breeding (6897 mother populations).

In addition, M BLUP-AM method was used in the evaluation of WI - 675 genealogical boar populations, WM - 243 genealogical boar populations, and L - 309 genealogical boar populations carried out from January 2000 to January 2002.

Methodology of evaluation has respected valid standards STN 46 6464 and 46 6150 used in the control of efficiency of individual breeding. The calculations of genetic and environment trends were based on the multidimensional animal system M BLUP by Peškovičová, Groeneveld *et al.* (1999).

### *Results*

The evaluation of reproduction parameters in mother populations for the years 1996 – 2001 is given in table1. As far as the individual reproduction trends are concerned, the results achieved were as follows: WI and WM tend to rise slightly in all new-born pigs (ABA), namely in WI numbers have risen from 10.7 (1996) to 11.2 piglets (2001), in WM from 10.9 (1996) to 11.3 piglets (2001). The same tendency was observed in the number of born alive (BA) and reared piglets (R). Mortality was as follows: WI 0,8 - 0,9 piglets and WM 0,8 - 1,1 piglets. Landrace showed decreased reproduction efficiency in all parameters. The evaluation of mother populations carried out in the testing stations of fattening and carcass value based on all population averages during the years 1996 – 2001 is shown in table 2.

Legend: di - difference interval of all population Averages of Mother population during the years 1996-2001/razlika intervala za proseke svih populacija majki tokom perioda 1996-2001

Landrace achieved the best evaluation as far as production parameters of mother populations are concerned. It also achieved an all population average from 30 to 100 kg, namely 847.7g, s 94.3 with difference min-max – 23.4g / +31.3g at consumption 37.0 ME / MJ, s 0.32, and feed mixture consumption / 1 kg gain – 2.93 kg, s 0.32.

The second best results were achieved in WI whose daily gain was 811.9 g, s 110.4, with difference min-max – 25.5g / + 29.1g at consumption 37.19 ME / MJ, s 0.29, and feed mixture consumption 2.95 kg, s 0.40.

Landrace also achieved the highest carcass value parameters, namely: back fat thickness – 1.79, s 0.39, difference min-max –0.14cm / + 0.17cm, *m.l.d.* 47.86 cm<sup>2</sup>, s 6.86, and carcass loin value 52.18 %, s 2.69, and difference min-max –1.66 %/ + 1.62%

WI achieved the lowest values in all production parameters during the years 1996 - 2001 with respect to all population averages. The evaluation of the best genealogical boar populations based on mother breeds is shown in Table 3.

The evaluation of individual genealogical populations in Slovakia during 2000- 2002 was based on the estimation of a total breeding value. The best values for WI breed were achieved by Pintos 1857 / 4015 ranging

min. - max. from 554.3 to 806.2 (TBV) total breeding value from Agro Insemas in Ratka. Further best values were achieved in the following populations: Faber 1398 / 4003 – 4004 – 4005 – 4006 ranging from 633 to 771.8 (TBV) total breeding value from ISK Kružno, Amulet 1818/ 4016 ranging from 618.2 to 708.5 (TBV) total breeding value from AC Agrospol in Bolkovce.

WM breed the best genealogical boar populations ranked as follows: Don 884 / 4103 – 4114 ranging from min. – max. 550.06 – 701.7 (TBV) total breeding value from the agricultural cooperative (AC) Hontianske Moravce, Rank 1692 / 1010 ranging from 570.1 – 636.7 (TBV) total breeding value from the AC in Krakovany- Stráže, Norik 1479 / 4005 – 4006 – 4007 ranging from 576.9 to 614.5 (TBV) total breeding value from the AC in Senica.

L breed the best Floppy 1917 / 4015 – 4013 – 4003 ranging min. – max. from 300.9 to 730.6 (TBV) total breeding value from the AC in Koval'ov, Damborek 1470 / 4012 ranging from 612.7 to 634.3 (TBV) from the AC Krakovany-Stráže, Don 884/ 4038 ranging from 563.6 – 723.4 (TBV) from ISK Hurbanovo. The distribution of breeding values of traits according to M BLUP-AM based on extreme limits for boar populations and total breeding value in the “top ladder” are shown in table 4.

*Table 4. Economical factors for prediction of breeding values M BLUP-AM based on extreme limits according to the individual boars of mother population*

*Tabela 4. Ekonomski faktori za ocenu priplodne vrednosti M BLUP-AM na bazi ekstremnih granica prema pojedinačnim nerastovima iz majčinske populacije*

L	20	53	28.2	-0.19	49.4	1.65	-0.23	0.38	0.29	324.6

Legend: TBV/UPV - total breeding value/ukupna priplodna vrednost, Sk - Slovak piece

The breeding values for each trait express a predicted genetic deviation of the animal in question with respect to the average value of a particular mother breed expressed in total breeding value and/or in Sk.

The highest total breeding value in the “top ladder” by Jun 30, 2002 was achieved in WI – 741.4 (TBV) total breeding value (top 01). The same value was achieved by 6 boar populations.

The second best value was achieved in two boar populations WM with 660.7 (TBV) total breeding value (top 01). The lowest values were found in three boar populations L with 654.4 (TBV) total breeding value (top 01). The low values achieved in reproduction parameters resulted markedly in the low values of total breeding values.

## ANALIZA REPRODUKTIVNIH I PROIZVODNIH PARAMETARA ŽENSKIH POPULACIJA I GENEALOŠKE POPULACIJE NERASTOVA M BLUP-AM METODOM U SLOVAČKOJ

*B. Bobček, P. Řeháček, V. Matoušek*

### *Rezime*

U ovom radu se ocenjuju proseci svih majjinskih populacija koji se odnose na reproduktivne i proizvodne parameter u Slovačkoj u periodu 1996-2001.

Priplodna vrednost populacija nerastova rasa WI-bela oplemenjena, WM-bela mesnata i L-landras tokom perioda 2000 - 2002 je ocenjivana metodom M BLUP-AM.

Na osnovu dobijenih ukupnih proseka populacija, najbolje rase u pogledu reproduktivne efikasnosti su bile WI-bela oplemenjena i WM-bela mesnata.

Na osnovu ukupne priplodne vrednosti (TBV/UPV), najbolje genealoške ženske populacije su ocenjene I uključene u “skalu”.

U Slovačkoj, najbolje genealoške populacije rase WI-bela oplemenjena su bile sledeće: Pintos sa 806 (TBV/UPV) ukupne priplodne vrednosti, Sunar sa 784,1 (TBV/UPV) i Faber sa 771,8 (TBV/UPV) ukupne priplodne vrednosti.

Najbolji rezultati za genealoške populacije nerastova (rase WM-bela mesnata) su postignuti kod Dona sa 701,7 (TBV/UPV) ukupne priplodne vrednosti, Ranka sa 636,7 (TBV/UPV) ukupne priplodne vrednosti i Norika sa 614,5 (TBV/UPV) ukupne priplodne vrednosti.

Najbolje populacije rase landras su bile sledeće: Floppy sa 730.6 (TBV/UPV) ukupne priplodne vrednosti, Damborek sa 634.3 (TBV/UPV) i Don sa 723.4 (TBV/UPV) ukupne priplodne vrednosti.

M BLUP-AM metoda je omogućila precizno određivanje genetske vrednosti pojedinačnih životinja i rasa i obezbedila objektivnije kontolisanu selekciju i dalje oplemnjivanje rasa svinja.
